

Using Microsoft Excel as your Adexa user interface

June 2016

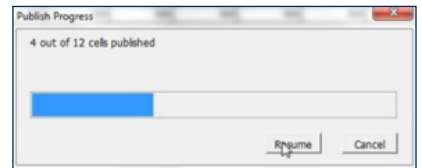

Microsoft claims there are over a billion people using Office. Excel is a key part of Office for those billion people. It is especially key for planners. We get it. In fact, import and export to Excel has always been a big part of our user interfaces. But let's move beyond that. What if you could use Excel exclusively as your user interface?

Instead of just static spreadsheets that can get out of sync with the changes made by others you could have a live connection to your Adexa product and to the other users. Instead of user interface screens you need to learn and teach to others you could hook up your own familiar spreadsheets with Adexa connections for reading and writing.

And, while we are at it, what happens when you are in the airport waiting area, in the middle of uploading a ton of changes you've made to your spreadsheets, and they call your flight? Instead of aborting that big upload you could simply pause in the middle of it and when you get to your destination just click "resume".

That is where we are going with our 2016 Excel initiative. Would you like to know more? If you are an existing client simply send a request to support@adexa.com and we will give you access to a series of demo videos showing you what you will soon be able to do.
